

Paper 2:->ChatGPT: The End of Online Exam Integrity?

So in this paper we had the chance to learn that to build Socra and make sure it works it would be tested on the following protocols:

1. Relevance -> Is the idea being expressed relevant to the topic or question at hand? Does it address the complexities of the issue?
2. Clarity -> Is the text easy to understand, Is it well-structured and logically organized.
3. Accuracy -> Is the idea being expressed true or accurate? Can it be verified through evidence or other means?
4. Precision -> Is the idea being expressed specific and detailed enough? Is it precise and unambiguous?
5. Depth -> Does the text provide a thorough and in-depth analysis of the topic? Does it consider multiple perspectives and present a balanced view?
6. Breadth -> Does the idea being expressed consider the full range of relevant perspectives and viewpoints on the issue.
7. Logic -> Does the idea being expressed follow logical and consistent reasoning.
8. Persuasiveness -> Does the text effectively persuade the reader to accept its arguments or conclusions? Is the evidence presented strong and convincing.
9. Does the text effectively persuade the reader to accept its arguments or conclusions? Is the evidence presented strong and convincing?

How it can be structured into course:

- We can use multi-modal channels for exam questions like we can use Embedded Images in exam questions which can make it more difficult for students to cheat and for GPT to generate accurate responses/
- As in cse labs we can use or experiment with pre-recorded videos that combine verbal questions with images and they should answer increasing the difficulty to cheat.

As we know that AI agents were trained on a large dataset of humans so we have to make sure it doesn't hallucinate. As the AI agent has exceeded mere memorization and information retrieval capabilities afforded by current web search engines, and is instead now able to conceptualize and demonstrate higher order thinking

Susnjak (2022) — Synopsis

This paper was one of the first to formally demonstrate that ChatGPT can pass university-level exams with minimal input, producing answers indistinguishable from human responses. It argues that this makes traditional online exam integrity measures — proctoring, plagiarism detectors — fundamentally insufficient, and that the education system needs to rethink how it assesses students entirely.

Core Finding

ChatGPT has moved beyond simple memorization and information retrieval. It can demonstrate higher order thinking, conceptualize ideas, and construct reasoned arguments — meaning it can do the cognitive work that exams are designed to test. Detection-based solutions are not foolproof and will not solve this problem long term.

The 9 Critical Thinking Dimensions

The paper evaluates ChatGPT responses against nine dimensions of quality: Relevance, Clarity, Accuracy, Precision, Depth, Breadth, Logic, and Persuasiveness. These dimensions collectively define what genuine higher order thinking looks like — and become the evaluation framework for whether a student response demonstrates real understanding or surface-level retrieval.

Structural Recommendations for Courses

The paper suggests moving toward multimodal assessments — embedding images into questions and using pre-recorded video prompts — to raise the difficulty of AI-assisted cheating since current models struggle more with visual and contextual inputs than pure text.
